- Henry's law constants (aqueous phase)
  - *Computational methods*
  - *Results*

- Radioactive iodine ( $^{131}\text{I}$ ) released in the atmosphere in case of a nuclear power plant accident.

- Speciation of iodine species: gas phase, aerosols.
  - Need to determine their gas-phase stability (thermodynamic properties, reactivity) and their mass transfer to liquid phase ( $k_H$ ,  $\alpha$ ).

- Context
  
- Thermodynamic properties (gas phase)
  - *Computational methods*
  - *Results*
  
- Microhydration (gas phase)
  
- Henry's law constants (aqueous phase)
  - *Computational methods*
  - *Results*

- Aim: Thermochemical properties within **chemical accuracy** ( $\pm 4.18 \text{ kJ mol}^{-1}$ )

## Step 1

### Structures:

- ❑ Optimized geometries and vibrational frequencies calculated at the  $U\omega B97XD/ \text{aug-cc-pVTZ}$  level of theory (**ECP28 for I**).
- ❑ Test systematically the stability of the DFT and HF wave functions.

Difficulties associated to the presence of heavy elements

**Electron correlation**  
Within valence electrons and chemical bonds

## Step 2

### Energetics:

- ❑ Potential energies calculated at the  $U\omega B97XD/\text{aug-cc-pV5Z}$  and  $UCCSD(T)/CBS (T,Q,5)$  with  $\omega B97XD$  optimized geometries.

**Multiconfigurational wave functions ?**  
*Unpaired electrons*

## Step 3

### Spin-orbit coupling (SOC in $\text{kJ mol}^{-1}$ ):

- ❑ RASSCF/CASPT2/RASSI

**Relativistic effects**  
*Heavy elements*

INO	INO <sub>2</sub>	Cis-IONO	Trans-IONO	IONO <sub>2</sub>	ICl	IBr	HI
-4.93	-5.51	-6.76	-5.96	-7.22	-6.78	-7.57	-2.26

## Step 4

### Thermochemical properties ( $\Delta_f H^\circ_{298K}$ , $\Delta_r H^\circ(T)$ , $\Delta_r G^\circ(T)$ ):

- Isogyric reaction is used to determine the standard enthalpy of formation.
  - “A reaction in which the number of electron pairs is conserved” from IUPAC Gold Book”
  - Set of 4 reactions (x = 1, 2, and 3)
    - ❖  $INO_x + H = I + HNO_x$
    - ❖  $INO_x + H_2 = HI + HNO_x$
    - ❖  $INO_x + HCl = ICl + NO_x$
    - ❖  $INO_x + HBr = IBr + NO_x$
  - Standard enthalpies of formation for reference species (kJ mol<sup>-1</sup>) (JPL 2015)

H	I	H <sub>2</sub>	HCl	HBr	HI	ICl	IBr	HNO	HONO	HNO <sub>3</sub>
217.997	106.76	0.00	-92.31	-36.29	26.50	17.393	40.807	109.2	-78.45	-143.5
± 0.001	± 0.04		± 0.10	± 0.16	± 0.10	± 0.040	± 0.14	± 2.1	± 0.80	± 0.5

- Standard enthalpy of formation at 298 K calculations for target species:

- $\Delta_r H^\circ_{298K} = \Delta E + \Delta ZPE + \Delta ddH_{298K} + \Delta SOC$

- $\Delta_r H^\circ_{298K}$  is obtained using Hess' law

$$\Delta_f H^\circ_{298K}(INO) = \underbrace{-\Delta_r H^\circ_{298K}}_{\text{Calculations}} + \underbrace{\Delta_f H^\circ_{298K}(HI) + \Delta_f H^\circ_{298K}(NO) - \Delta_f H^\circ_{298K}(H)}_{\text{From literature [JPL 2015]}}$$

Calculations

From literature [JPL 2015]

- ❑ Turbomole and COSMOthermX used in literature:
  - Parnis *et al.*, Atmos. Environ., 110 (2015), 27-35
  - Dougassa *et al.*, J. Chem. Thermo., 79 (2014), 49-60
- ❑ Optimized geometries at the BP/def-TZVP level of theory with m4 grid.
- ❑  $\epsilon_r$  dielectric constant set to  $\infty$
- ❑ H<sub>2</sub>O from COSMOthermX database
- ❑ Henry's Law Constant expressed in MPa (the volatility constant H)  
→ conversion to mol L<sup>-1</sup> atm<sup>-1</sup> ( $k_H$ )

# Henry's law constants

# Henry's law constants

Species	$k_H$ (298 K) (mol L <sup>-1</sup> atm <sup>-1</sup> ) COSMOtherm
INO	$4.90 \times 10^{-2}$
INO <sub>2</sub>	$4.14 \times 10^{-3}$
Cis-IONO	$8.74 \times 10^{-3}$
Trans-IONO	$2.04 \times 10^{-2}$
IONO <sub>2</sub>	$3.32 \times 10^{-2}$

□ Note:

- $k_H(298K)$  (INO<sub>2</sub>) =  $3.00 \times 10^{-1}$  mol L<sup>-1</sup> atm<sup>-1</sup>  
→ Valeur BrNO<sub>2</sub> [5]
- $k_H(298K)$  (IONO<sub>2</sub>) =  $10^6$  mol L<sup>-1</sup> atm<sup>-1</sup>  
→ Virtual infinite solubility [5]: IONO<sub>2(aq)</sub> + H<sub>2</sub>O<sub>(aq)</sub> = HOI<sub>(aq)</sub> + HNO<sub>3(aq)</sub>

# Henry's law constants

# Henry's law constants

$$\frac{k_H(T)}{k_H(298\text{ K})} = \exp\left(\frac{-\Delta_{sol}H^\circ}{R} \left(\frac{1}{T} - \frac{1}{298}\right)\right)$$

Species	$\Delta_{sol}H^\circ$ (kJ mol <sup>-1</sup> )
COSMOthermX	
INO	- 20.5
INO <sub>2</sub>	- 12.5
Cis-IONO	- 17.5
Trans-IONO	- 20.1
IONO <sub>2</sub>	- 18.5

- ❑ Reassessment of literature standard enthalpies of formation for  $\text{INO}_x$ .
  - ❖ *Complete benchmark by performing CASPT2/CASSCF calculations,*
  - ❖ *Estimate the corrections due to higher correlation methods such as CCSDT(Q) (CFour).*
  
- ❑ Microhydration processes:
  - ❖ *Extend study to  $\text{IONO}_2 + n \text{H}_2\text{O} = \text{IONO}_{2-n}\text{H}_2\text{O}$  ( $n = 2, 3, \dots$ )*
  
- ❑ Prediction of Henry's law constants for iodine-containing species.
  - ❖ *Complete study by using SMD methodology as implemented in Gaussian16*

# Thank you for your attention

**Acknowledgment:** This work was part of the MiRE project (Mitigation of outside releases in case of nuclear accident), which is funded by the French National Research Agency (ANR) through the PIA (Programme d'Investissement d'Avenir) under contract "ANR-11-RSNR-0013-01". We appreciate also the support from PIA managed by the ANR under grant agreement "ANR-11-LABX-0005-01" called CaPPA (Chemical and Physical Properties of the Atmosphere), and, also supported by the Regional Council "Nord-Pas de Calais" and the "European Funds for Regional Economic Development". We thank Slovak Grant Agencies VEGA (Grant 1/0092/14) and APVV (Project APVV-15-0105) for support. This work was performed in the frame of the international collaboration agreement between IRSN, Comenius, Lille 1, and CNRS.
